## SECURITY AND ACCESS CONTROL

Titan provides security features such as industry standard Secure Sockets Layer (SSL) for encrypted file transfers, and S/Key MD4 and MD5 password encryption.

Several security controls are available to limit abuse. Titan provides the ability to block anti-timeout measures that some clients use to keep a connection while idle. Access can also be blocked if a client attempts a given number of bad commands or invalid passwords.

Titan also provides comprehensive access control including the ability to enable or disable anonymous access, and permit or deny access based on IP address. FXP and PASV mode transfers can be blocked and bandwidth throttling allows customizing of the maximum bandwidth given to any server/user. Upload/download ratios can be configured and disk quotas can be set. The Titan administrator has total control over who has access, how and how much they access.

In multi-server installations, Titan supports Secure FXP (direct server-to-server file transfers) by way of the SSCN and CPSV commands.

## EASY, WIZARD-DRIVEN SETUP

Titan FTP Server provides easy to use wizards to walk the administrator through the entire server setup. Wizards are available for creating domains, servers, groups and users, and for configuring security options.
